Abstract: Taking township domestic sewage as samples, the small device which cultivated by anaerobic sludge was used to construct the environment of aerobic biological with the method of continuous into water and continuous aeration, and the efficiency of pollutants removal was being observed. The results indicated that under the condition of normal temperature, sewage inflow 4 L/d, HRT 12 h, average COD 400 mg/L, $\text{NH}_4^+ - \text{N}$ 20 mg/L, TN 25 mg/L, TP 4 mg/L; after 12 days, sewage outflow COD 39.80 mg/L, $\text{NH}_4^+ - \text{N}$ 0.98 mg/L, TN 8.32 mg/L, TP 0.96 mg/L; after 29 days, COD and $\text{NH}_4^+ - \text{N}$ removal efficiency can both reach 90.0%, and aerobic activated sludge grew well. It showed the aerobic biological treatment system was successfully constructed.

Keywords: sewage; anaerobic start-up aerobic; chemical oxygen demand; ammonia nitrogen; pollutants removal
